**Fluid Flow™**

amniotic liquid allograft

### What is Fluid Flow™?

Fluid Flow™ is an amniotic liquid allograft derived from the amniotic fluid within the placenta. It is used by health practitioners to safely and effectively treat soft tissue pain and inflammation, while promoting regeneration of our bodies to their optimal health.

### What is Human Amniotic Fluid?

Amniotic fluid is abundant in growth factors and cytokines associated with repair, replacement, and regeneration of soft tissue. When injected into the body, these growth factors and cytokines have been shown to promote healing and pain management.

### Is Fluid Flow™ comfortable?

Yes. The major advantage of the Fluid Flow™ technology is its ability to effectively treat the condition while enabling the patient to maintain a comfortable, functional, and high-quality lifestyle.

### Is Fluid Flow™ safe?

Yes. The safety and quality of Fluid Flow™ is carefully controlled. Fluid Flow™ liquid allograft is processed following stringent FDA regulations and requirements.

### What types of conditions are treatable with Fluid Flow™?

The biologic components of Fluid Flow™ are often used as part of a treatment regimen to successfully combat pain and inflammation in soft tissue of the lower extremities. It has been shown to be an excellent modality for treating the symptoms of arthritis, plantar fasciitis, and tendinitis.

### What clinical benefits have been shown with Fluid Flow™?

The biologic components of Fluid Flow™ have been shown to reduce inflammation, promote healing, and enhance comfort.

### How long has Fluid Flow™ been used by Healthcare Practitioners?

For several decades, health practitioners around the world have used amniotic liquid allografts to treat a variety of disorders and conditions.

### Benefits of Using Fluid Flow™

The components of Fluid Flow™ have been shown to activate the body's own healing response, which is characterized by minimal inflammatory activity and regenerative rather than scar-mediated healing.

Fluid Flow™ is composed of a complex array of growth factors and cytokines responsible for the repair, replacement, and regeneration of soft tissue. Because of its inherent anti-inflammatory and anti-scarring properties, these same components have been used clinically as an additive for surgical applications associated with soft tissue procedures.
